Tests on the process of defibration of semi-chemical pulp carried out on a semi-technical model of a Sprout-Waldron disc refiner lead to the following conclusions: (1) An important evaluation index to the defibering process should be screen analysis of the product by the method proposed. The process must be so conducted as to maintain the pulp with minimum contents of 'coarse' and 'overfine' fractions. The appropriate

Laboratory tests showed that starch gelatinized in water (in a hot state) is retained by cellulose fibres in quantities not exceeding 3% and almost irrespectively from the amount of starch added based on the weight of the fibres. Starch prepared by this method should not be added into the hollander in quantities greater than 5% by weight. Most suitable is the addition of starch (Materials--Paper, TT, v. 7, no. 8) (over)
